

DESMI pumps are used in connection with fishfarming

Pumps from DESMI have been used for fish farming for more than 30 years and our knowledge of materials for both fresh and seawater means that we are able to deliver highly efficient pumps which can help to reduce production costs throughout the process regardless of whether they are on a flow-through or recirculation system.

DESMI centrifugal pumps are the service-friendly alternative to submersible pumps.

- Space-saving NSL and DSL pumps
- Easy access for maintenance of the rotating parts. Replaceable wear ring in pump casing. NSL and DSL pumps have high efficiency and low NPSHr values.
- Material combinations for both freshwater and seawater – based on long experience.

We have pumps that can be used throughout the entire process, from "Hatchery tanks" to "Growout tanks", for transport to and from the oxidation, to transport to the degassing plant. Whether you need small or large pumps, we have the solution.

Choosing the right pump is of decisive importance when transporting liquids:

- Reduced water and power consumption
- Reduced spill of feed and faeces
- Improved water quality reducing the risk of disease and increasing the profitability

Dry-mounted DESMI centrifugal pump:

- Our environmentally and service friendly pump solutions are an alternative to submersible pumps
- Our pumps are mounted above liquid level and only the suction line is submerged
- There is always easy access to the pump, and service is possible without hoisting the pump or running a health risk
